March 24, 2016

Agenda

- (10:00 - 10:30) Introduction to information sharing
- (10:30 - 12:00) MISP general usage
- (12:00 - 13:00) Lunch
- (13:00 - 14:30) MISP administration
- Extending MISP and contributing
 - (14:30-15:00) 3.0 PyMISP
 - (15:00-15:20) 3.1 MISP modules
 - (15:20-15:30) 3.2 Taxonomy and tagging
 - (15:30-15:40) 3.3 Viper MISP integration
- (15:40-16:10) MISP future

MISP and starting from a practical use-case

- During a malware analysis workgroup in 2012, we discovered that we worked on the analysis of the same malware.
- We wanted to share information in an easy and automated way **to avoid duplication of work.**
- Christophe Vandeplass (then working at the CERT for the Belgian MoD) showed us his work on a platform that later became MISP.
- A first version of the MISP Platform was used by the MALWG and **the increasing feedback of users** helped us to build an improved platform.

Development based on practical user feedback

- There are many different types of users of an information sharing platform like MISP:
 - **Malware reversers** willing to share indicators of analysis with respective colleagues.
 - **Security analysts** searching, validating and using indicators in operational security.
 - **Intelligence analysts** gathering information about specific adversary groups.
 - **Law-enforcement** relying on indicators to support or bootstrap their DFIR cases.
 - **Risk analysis teams** willing to know about the new threats, likelihood and occurrences.
 - **Fraud analysts** willing to share financial indicators to detect financial frauds.

Many objectives from different user-groups

- Sharing indicators for a **detection** matter.
 - 'Do I have infected systems in my infrastructure or the ones I operate?'
- Sharing indicators to **block**.
 - 'I use these attributes to block, sinkhole or divert traffic.'
- Sharing indicators to **perform intelligence**.
 - 'Gathering information about campaigns and attacks. Are they related? Who is targeting me? Who are the adversaries?'
- → These objectives can be conflicting (e.g. False-positives have different impacts)

Sharing Difficulties

- Legal restriction
 - "Our legal framework doesn't allow us to share information."
 - "Risk of information leak is too high and it's too risky for our organization or partners."
- Practical restriction
 - "We don't have information to share."
 - "We don't have time to process or contribute indicators."
 - "Our model of classification doesn't fit your model."
 - "Tools for sharing information are tied to a specific format, we use a different one."

Quick MISP introduction

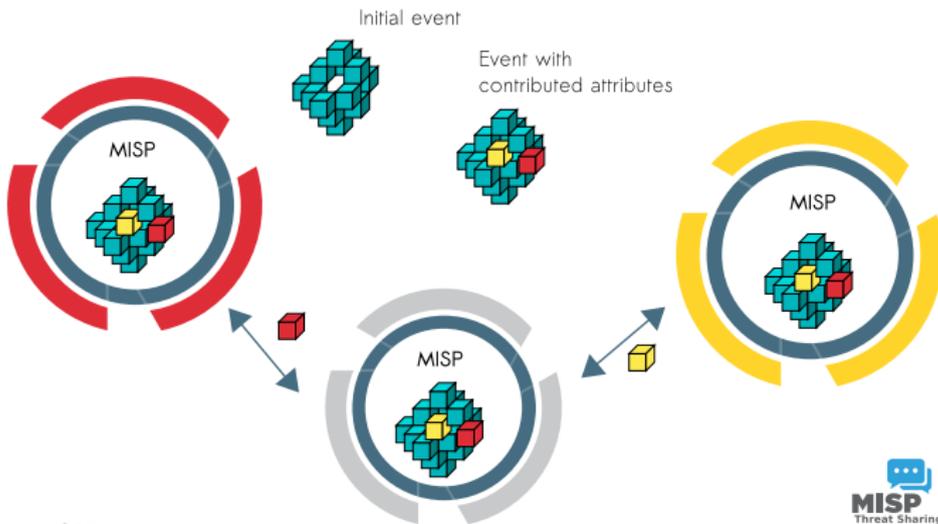

- MISP¹ is an IOC and threat indicators sharing free software.
- MISP has **many functionalities** e.g. flexible sharing groups, automatic correlation, free-text import helper, event distribution and collaboration.
- CIRCL operates multiple MISP instances with a significant user base (around 320 organizations with 800 users).
- After some years of trial-and-error, we explain the background behind current and new **MISP features**.

¹<https://github.com/MISP/MISP>

MISP core distributed sharing functionality

- MISP's core functionality is sharing where everyone can be a consumer and/or a contributor/producer.
- Quick benefit without the obligation to contribute.
- Low barrier access to get acquainted to the system.

Events and Attributes in MISP

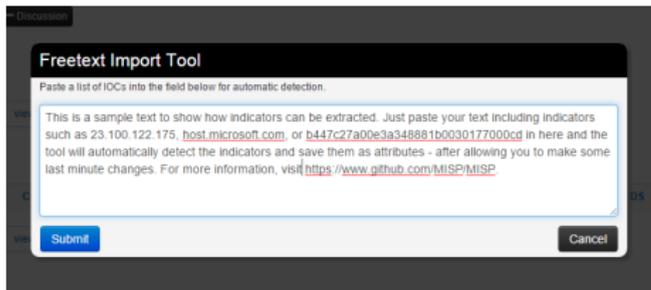

- MISP attributes² initially started with a standard set of "cyber security" indicators.
- MISP attributes are purely **based on usage** (what people and organizations use daily).
- Evolution of MISP attributes is based on practical usage and users (e.g. recent addition of the **financial indicators** in 2.4).
- In version 3.0, MISP objects and galaxy will be added to give the freedom to the **community to create new and combined attributes** and share them.

²attributes can be anything that helps describe the intent of the event package from indicators, vulnerabilities or any relevant information

Helping Contributors in MISP

- Contributors can use the UI, API or using the freetext import to add events and attributes.
 - Modules existing in Viper (a binary framework for malware reverser) to populate and use MISP from the vty or via your IDA.
- Contribution can be direct by creating an event but **users can propose attributes updates** to the event owner.
- **Users should not be forced to use a single interface to contribute.**

Example: Freetext import in MISP

Freetext Import Results

Below you can see the attributes that are to be created. Make sure that the categories and the types are correct, often several options will be offered based on an inconclusive automatic resolution.

Value	Category	Type	IDS	Comment	Actions
23.100.122.175	Network activity	ip-dst	<input checked="" type="checkbox"/>	Imported via the freetext import.	
host.microsoft.com	Network activity	hostname	<input checked="" type="checkbox"/>	Imported via the freetext import.

Supporting Sharing in MISP

- Delegate events publication to another organization (introduced in MISP 2.4.18).
 - The other organization can take over the ownership of an event and provide **pseudo-anonymity to initial organization**.
- Sharing groups allow custom sharing (introduced in MISP 2.4) per event or even at attribute level.
 - Sharing communities can be used locally or even cross MISP instances.
 - **Sharing groups** can be done at **event level or attributes level** (e.g. financial indicators shared to a financial sharing groups and cyber security indicators to CSIRT community).

Conclusion

- **Information sharing practices come from usage** and by example (e.g. learning by imitation from the shared information).
- MISIP is just a tool. What matters is your sharing practices. The tool should be as transparent as possible to support you.
- Enable users to customize MISIP to meet their community's use-cases.
